

Swap Request Notification System

Loonie Bird — Melanie's Music Studio

Overview

The Swap Request Notification System enables students, their guardians, and the studio teacher to communicate automatically at every stage of the lesson-swap process. When a student initiates a swap request through the app, the system generates a pre-composed email that opens in the device's native email client — addressed, CC'd, and fully written. The user simply taps Send.

All email routing is determined by the student's designated primary contact, a new field added to each student profile. No third-party service or server configuration is required; the system relies entirely on the device's built-in email app via standard *mailto:* links.

Profile Updates

Teacher Profile	Student Profiles
A new Studio Website field has been added to the teacher's profile form. The URL entered here is embedded in all student-facing email notifications as the link students are directed to when accepting or reviewing a swap request.	Each guardian entry in a student's profile now includes a Primary Contact radio button. The first guardian is designated as primary by default; this can be changed at any time. The primary contact's name, email address, and phone number are displayed in a teal banner at the top of the student's profile card for quick reference, and are the contact details used for all swap-related email notifications. The selection persists across sessions.

Email Notification Flow

Five distinct email notifications are generated across the lifecycle of a swap request. Each is triggered by a specific in-app action and opens a pre-addressed, pre-written email in the acting user's native email client.

1

Student A Requests a Swap

To: Student B's primary guardian CC: Teacher

Sent from Student A's device when the swap request is submitted. Includes both students' lesson times, the reason entered by Student A, a link to the studio website, and Student A's contact phone number in case Student B prefers to respond directly.

2

Student B Accepts the Request

To: Student A's primary guardian CC: Teacher

Sent from Student B's device when Student B taps Accept in the student portal. Confirms both lesson times and advises that the swap is now pending teacher approval. The teacher receives a copy so they are aware the swap is ready for review.

3

Student B Declines the Request

To: Student A's primary guardian CC: Teacher

Sent from Student B's device when Student B declines. Includes the reason for declining and advises Student A to contact the teacher if rescheduling is still needed.

4

Teacher Approves the Swap

To: Student A's primary guardian CC: Student B's primary guardian

Sent from the teacher's device upon approval. Both students' updated lesson times are confirmed in the email body. The teacher is not copied — they are the sender.

5

Teacher Declines the Swap

To: Student A's primary guardian CC: Student B's primary guardian

Sent from the teacher's device upon declining. Both students are informed that their original lesson times remain unchanged and are encouraged to contact the teacher with questions.

Graceful fallback: If no email address is on file for a student's primary contact, the app displays a brief in-app notification rather than attempting to open a blank email.

Technical Notes

All notifications use the standard *mailto:* URI scheme, which is supported on every modern operating system and requires no configuration. When triggered, the device's default email client opens with the To, CC, Subject, and Body fields pre-populated. The acting user reviews the message and taps Send — one tap, no typing required.

Because emails originate from the user's own email account, replies land naturally in their inbox and the full conversation thread is preserved in their Sent folder. No external service, API key, or backend infrastructure is required.
